<b>Purpose of Flight:</b>	Check		
<b>Comments:</b>	<p>This was a troubleshooting flight as we try to understand the unknown cause of an unwanted vibration. We had tightened the upper inboard SAGA inlet leading edge. This required drilling and installing new set screw to repair the leading edge component that was loose and the suspected source of vibration. The vibration did return. However, it was diminished in amplitude and basically only occurred when at bank angles greater than 20 deg and at higher altitudes (approx 35kft). These flight vibration characteristics were significantly different than on the previous flights where the vibration occurred at wings level conditions. The aircraft returned in good condition although #2 thrust reverser did not deploy on landing.</p>
