Mission: OIB

Mission Summary:

Mission: ICESat-2 South (priority: high; last flown: new)

This is a new mission, designed along ICESat-2 ground tracks to fill the gap between the southeastern and southwestern suites of missions. We sample a total of six ICESat-2 orbits, mixing left, nadir, and right beam pair overflights. We also overfly a firm compaction study site at point Saddle.

A clear forecast across southern central Greenland finally favored this mission mostly along ICESat-2 tracks. ATM T5 was initially out of alignment but was remedied prior to the beginning of primary data collection. A low cloud blank at the southern tip of Greenland prevented altimetry data collection in the southernmost ~30 km of the two most southeasterly tracks, but otherwise data collection proceeded successfully throughout the mission under mostly clear skies. Finally, we collected an east-to-west ramp pass at 1500°.
