

DC-8 - AFRC 10/10/18 - 10/11/18

Aircraft:

DC-8 - AFRC ([See full schedule](#))

Flight Number:

1291

Payload Configuration:

ATM GPS/NAV_ATM Headwall_ATM-T6/T7_ATM FLIR_ATM CAMBOT, MCoRDS/UWB Radar, Gravimeter

Nav Data Collected:

Yes

Total Flight Time:

11.5 hours

Submitted by:

Chris Jennison on 10/17/18

Flight Segments:

From:	SCCI	To:	SCCI
Start:	10/10/18 13:12 Z	Finish:	10/11/18 00:43 Z
Flight Time:	11.5 hours		
Log Number:	198006	PI:	Joseph MacGregor
Funding Source:	Bruce Tagg - NASA - SMD - ESD Airborne Science Program		
Purpose of Flight:	Science		
Comments:	Slessor Grounding Zone/Lake IS-2, which consisted mostly of some Icesat-2 tracks. We had a slight delay for an aircraft on the ramp, but pretty much everything all went smooth after that. The aircraft and science instruments all performed well. ATM: 100% data collection, instruments are all working well, no issues MCoRDS: 848GB collected data, no issues Snow Radar: 635GB collected data, instrument is working well, no issues Gravimeter: 4.1GB collected data, instrument is working well, no issues KT-19: 17MB		

Flight Hour Summary:

	198006
Flight Hours Approved in SOFRS	345.8
Total Used	292.8
Total Remaining	53

Mission:

OIB

Mission Summary:

Mission: Slessor Grounding Zone / Lake IS-2
Priority: High

This new flight is designed to map portions of the Slessor and Bailey Glaciers, along ICESat-2 ground tracks. For these tracks, we specifically target the strong beam of the beam pairs, which in the case of this flight are all center beam pairs and TEP.

This mission was the best available option, based on MODIS imagery and multiple model forecasts. Nothing farther west was viable, and only the Stancomb-Willis region could have been considered. At the beginning of the mission, we collected a 1500' ramp pass across the PUQ runway. We passed over the Antarctic Peninsula, but did not spot the A-68 iceberg due to clouds. About halfway across the Weddell Sea, the clouds cleared and extensive sea ice with intermittent icebergs were visible. During the survey, we saw blowing snow and impressively glazed surfaces within the windswept trough of Slessor Glacier, especially during the downstreammost across-flow lines, along with substantial cross-winds but minimal turbulence. Our first flight proceeded exactly as planned, and no major instrument issues were reported. It took about 15 minutes the beginning of the survey to get the IR sensor on the ATM T7 synched up with the laser returns, an adjustment that should not have to be repeated, but otherwise altimetry collection was 100%. MCoRDS ice-bed reflections were regularly visible, with some exceptions over regions of extensive surface crevassing.
